

Parametric Equations

Sketch the curve for each pair of parametric equations.

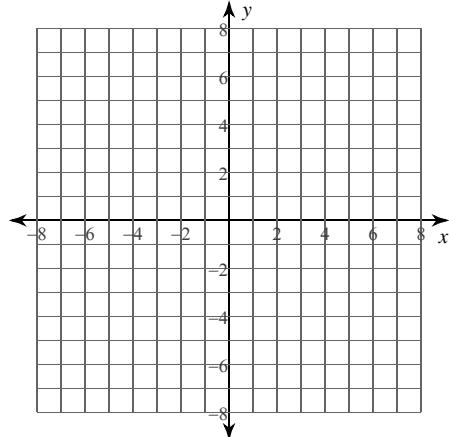

1) $x = t, \quad y = \frac{t^2}{4}$

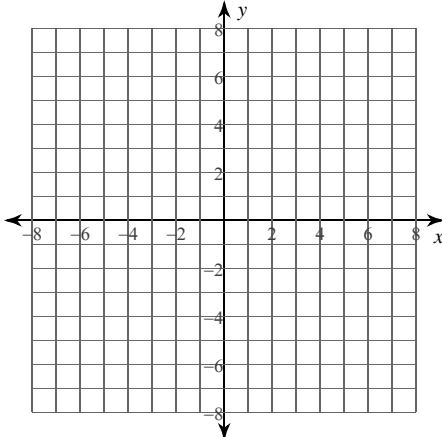

2) $x = -2t + 2, \quad y = \frac{4t^2}{5} - 2, \quad -2 \leq t \leq 3$

3) $x = 5\sin t, \quad y = 4\cos t$

4) $x = 2\sec t, \quad y = 4\tan t$

Write each pair of parametric equations in rectangular form.

5) $x = -\frac{t^2}{3}, \quad y = t$

6) $x = t, \quad y = \frac{t^2}{6} + \frac{2t}{3} - \frac{1}{3}$

7) $x = -2t - 3, \quad y = 2t^2 + 2t - \frac{5}{2}$

8) $x = 2\sin t, \quad y = 4\cos t$

9) $x = \sec t, \quad y = 4\tan t$

10) $x = 4\cos t - 1, \quad y = 3\sin t + 1$

Use the parameter to write each rectangular equation as a pair of parametric equations.

11) $x = \frac{y^2}{6}, \quad t = y$

12) $y = -\frac{x^2}{4} + x + 1, \quad t = -\frac{x}{3} + \frac{1}{3}$

Critical thinking questions:

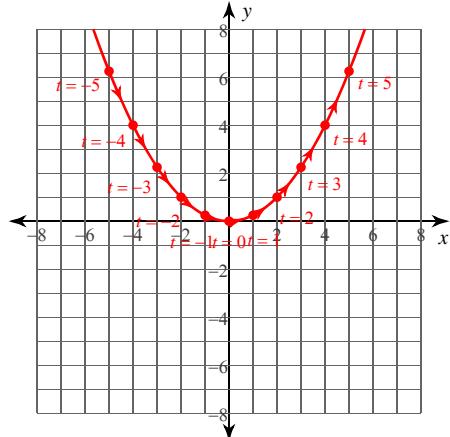

13) Write a set of parametric equations that represent $y = x^2 - 4x$. Then write a second set of parametric equations that represent the same function, but with a slower speed

14) Write a set of parametric equations that represent $y = x^2 - 1$. Then write a second set of parametric equations that represent the same function, but with a faster speed and an opposite orientation.

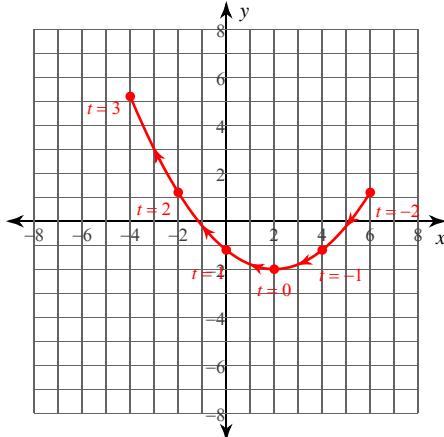

Parametric Equations

Sketch the curve for each pair of parametric equations.

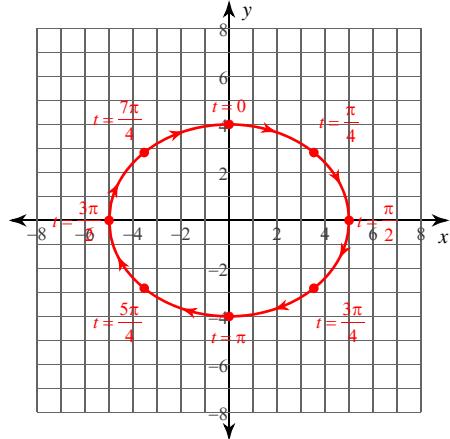

1) $x = t, \quad y = \frac{t^2}{4}$

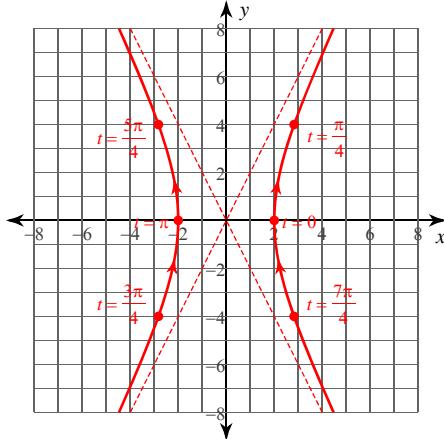

2) $x = -2t + 2, \quad y = \frac{4t^2}{5} - 2, \quad -2 \leq t \leq 3$

3) $x = 5\sin t, \quad y = 4\cos t$

4) $x = 2\sec t, \quad y = 4\tan t$

Write each pair of parametric equations in rectangular form.

5) $x = -\frac{t^2}{3}$, $y = t$

$x = -\frac{y^2}{3}$

6) $x = t$, $y = \frac{t^2}{6} + \frac{2t}{3} - \frac{1}{3}$

$y = \frac{x^2}{6} + \frac{2x}{3} - \frac{1}{3}$

7) $x = -2t - 3$, $y = 2t^2 + 2t - \frac{5}{2}$

$y = \frac{x^2}{2} + 2x - 1$

8) $x = 2\sin t$, $y = 4\cos t$

$\frac{x^2}{4} + \frac{y^2}{16} = 1$

9) $x = \sec t$, $y = 4\tan t$

$x^2 - \frac{y^2}{16} = 1$

10) $x = 4\cos t - 1$, $y = 3\sin t + 1$

$\frac{(x+1)^2}{16} + \frac{(y-1)^2}{9} = 1$

Use the parameter to write each rectangular equation as a pair of parametric equations.

11) $x = \frac{y^2}{6}$, $t = y$

$x = \frac{t^2}{6}$, $y = t$

12) $y = -\frac{x^2}{4} + x + 1$, $t = -\frac{x}{3} + \frac{1}{3}$

$x = -3t + 1$, $y = -\frac{9t^2}{4} - \frac{3t}{2} + \frac{7}{4}$

Critical thinking questions:

- 13) Write a set of parametric equations that represent $y = x^2 - 4x$. Then write a second set of parametric equations that represent the same function, but with a slower speed

Many answers. Ex: $y = t^2 - 4t$, $x = t$ and $y = \frac{t^2}{4} - 2t$, $x = \frac{t}{2}$

- 14) Write a set of parametric equations that represent $y = x^2 - 1$. Then write a second set of parametric equations that represent the same function, but with a faster speed and an opposite orientation.

Many answers. Ex: $y = t^2 - 1$, $x = t$ and $y = 4t^2 - 1$, $x = -2t$
